

Exam feedback: COMP50004 Operating Systems

Q1. All students did well in Part a, mostly obtaining full marks. Some marks were lost in Part b if the answer did not account for the two CPUs or assumed an incorrect definition of fairness. In Part c, full marks required a clear explanation of the problem in terms of the CPU time spent in the OS kernel that was not accounted for by the scheduler.

Q2. Part a) had good results, showing that students have a good understanding of the various memory translation mechanisms. Part b) had great results overall, but sometimes with a confusion between RAID-5 and other forms of RAID. Part c) had pretty good results, but many students had small errors on their i-node calculations, or misunderstood its intrinsic properties.
