

Paper 211 – Operating Systems

Question 1: Part 1a was well answered. In part 1b, some answers did not explain the role of the TLB in the context of a multi-core memory hierarchy. Part 1c was handled without problems by most students. A common mistake in part 1d was that answers did not reason about the previous process that was scheduled on a given CPU core. Only solutions that specifically focused on OS scheduler changes received full marks in part 1e.

Question 2: Parts 2a and 2b were well-answered, and most answers enumerated the possible program executions without issues. In part 2c, answers that proposed different, more efficient fork semantics, going beyond the standard optimisations covered in the lectures, received full marks.
